DETAILED ACTION

Oath/Declaration

1. This application presents a claim for subject matter not originally claimed or embraced in the statement of the invention. The original claims filed 29 June 2001 did not contain some subject matter that is now included in the present claims, specifically the method for setting a timeout value using the following algorithm:

```
if  $R_{actual}$  is  $<$  or  $>$   $R_{default}$  by  $(R_{default} * F)$ ,  
then  $T_{actual} = T_{default} + R_{actual} * N$ ;  
else  $T_{actual} = T_{default}$ , and  
where:  
 $R_{default}$  = default response duration,  
 $R_{actual}$  = actual response duration,  
 $T_{default}$  = default timeout value,  
 $T_{actual}$  = actual timeout value,  
 $F$  = deviation factor, and  
 $N$  = normalizing factor.
```

2. A supplemental oath or declaration is required under 37 CFR 1.67. The new oath or declaration must properly identify the application of which it is to form a part, preferably by application number and filing date in the body of the oath or declaration. See MPEP §§ 602.01 and 602.02.

EXAMINER'S AMENDMENT

3. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Kevin Zilka (Reg. No. 41,429) on 15 December 2005.

The application has been amended as follows:

The abstract of the present application has been amended as follows:

SYSTEM, METHOD AND COMPUTER PROGRAM PRODUCT
FOR IMPROVED EFFICIENCY IN NETWORK ASSESSMENT
UTILIZING VARIABLE TIMEOUT VALUES

Examiner has amended the abstract removing the title information. An amended copy of the abstract is attached.

ABSTRACT

A system, method and computer program product are provided for executing a risk-assessment scan with a variable timeout duration which is set based on network conditions. Initially, network conditions are measured in a network coupled between a source and a target. Subsequently, a risk-assessment scan is executed on the target from the source. A timeout is performed prior to making a determination that the target is failing to respond to the risk-assessment scan. Such timeout includes a variable duration which is set as a function of the measured network conditions.
